PROJECT REPORT

Project Title

Job Referral Management System

Objective of the Project

- In this project, we have **Companies, Employees, Jobs, Candidates, and Referrals** collections.
- We have to create a collection for each entity and establish relationships using MongoDB.
- We have to perform **CRUD operations (Create, Read, Update, Delete)** on all entities.
- The system allows companies to post jobs, employees to refer candidates, and candidates to apply for jobs.
- We have to implement the following relationships:
 - Company → Jobs (One-to-Many)
 - Employee → Referrals (One-to-Many)
 - Job → Company (Many-to-One)
 - Candidate ↔ Jobs (Many-to-Many)
 - Referral → Candidate (One-to-One)
- MongoDB will be used to store and manipulate data.
- APIs will be tested using **Postman** or **Swagger**.
- No frontend technology will be used in this project.

Technologies Used

- Java
- Spring Boot
- MongoDB
- Postman / Swagger

Main Operations

Company

- Create Company
- View Company
- Update Company
- Delete Company

Employee

- Create Employee
- View Employee
- Update Employee
- Delete Employee

Job

- Create Job
- View Job
- Update Job
- Delete Job

Candidate

- Create Candidate
- View Candidate
- Update Candidate
- Delete Candidate

Referral

- Create Referral
- View Referral
- Update Referral Status
- Delete Referral
